

MarketView CurveBuilder

by **drillinginfo**

Experience true end-to-end automation.

With MarketView CurveBuilder by Drillinginfo, easily create, validate, and automate a generation of simple or complex curves without the aid of a specialist.

MarketView CurveBuilder Core Benefits Include:

- Global Data Access
- Customer Proprietary Data Access
- Interpolate
- Straight-Through Processing
- Built-In Bootstrapping
- Term and Derived Curves
- Build Curves Programmatically
- Custom Roll Rules
- Public, Private and Group Curves
- Scheduling
- Snapshots
- Audit Trail
- C/ETRM Integration
- Front and Mid-Office Integration

350+

Energy & Commodity Data Sources

With MarketView CurveBuilder by Drillinginfo, you can choose from a vast data catalog of over 350 energy and commodity data sources or easily import your own proprietary data if desired.

MarketView CurveBuilder Features:

Global Data Access

Get instant access to over 350 real-time, delayed, and end of day data sources for the global energy and commodities market.

Customer Proprietary Data Access

Easily integrate your own proprietary data for blending with exchange, broker, and price reporting agency data sets.

Interpolate

Leverage built-in interpolation capabilities including Step, Cubic, Linear, and Monthly interpolation options.

Straight-Through Processing

Leverage MarketView CurveBuilder's straight-through processing capabilities to develop, test, schedule and push curves to your downstream risk management system in one tightly integrated platform.

Built-In Bootstrapping

CurveBuilder contains a highly sophisticated and proprietary set of algorithms for blending overlapping terms into a smoothed curve, thereby reducing volatility and insuring the lowest standard deviation possible.

Term and Derived Curves

Easily create term and derived curves using data from multiple asset classes and even incorporate your own proprietary marks. Develop curves from spreads, cracks, and other user-defined formulas.

Build Curves Programmatically

Develop and test curves programmatically by leveraging the power of MarketScript® Studio to bypass the CurveBuilder user interface.

Custom Roll Rules

Leverage industry standard roll rules from various data providers such as Platts, Argus, CME, and others or create your own custom rules for rolling various terms of a curve.

Public, Private, and Group Curves

Access public, private, and group curves all through the CurveBuilder symbol browser. Easily share private or group curves with others and leverage our built-in permissioning scheme to control read/write access.

Scheduling

Schedule time or event based curve execution. Receive real-time status alerts via e-mail and text or leverage the CurveBuilder Dashboard for real-time status updates.

Snapshots

Take regular snapshots of curves for historical justification in the event a curve changes due to a correction or some other event.

Audit Trail

Building curves in Excel is risky; use CurveBuilder to log and audit changes made to your curves. All actions are tagged with a user ID and timestamp, indicating when a curve has been changed.

C/ETRM Integration

GlobalView has strategic alliances with many of the major C/ETRM providers in the global commodity space. Any curve generated in CurveBuilder can be automatically and seamlessly consumed downstream.

Front and Mid-Office Integration

Any curve created in CurveBuilder is available in real-time for immediate consumption in all other MarketView products and data management solutions.

PROACTIVE

EFFICIENT

COMPETITIVE

By monitoring the market, Drillinginfo continuously delivers innovative oil & gas solutions that enable our customers to sustain a competitive advantage in any environment.

Drillinginfo customers constantly perform above their competitors because they are more efficient and more proactive than the competition.
